

User Interface Design, Corporate HMI System

# Salvagnini Face

← Back

Download ↓

Face is the corporate machinery operating system of the Salvagnini Group, aimed at unifying all existing as well as future software suites for metal working machines. It merges different types of applications to create a comprehensive and consistent design system. Thanks to fail-proof guided paths, visual production overviews and a fully customisable dashboard, the system helps users be productive more quickly, manage strict deadlines more easily and recover from failures without external assistance. Distributed across different machines, the consistent and intuitive interface supports users in every phase of the production.
